

MindWealth Web App

Portfolio Page — Implementation Spec + Brief for Parth

Version: June 2026 · Reference file: `mindwealth_portfolio_v4.html` (attached)

Hi Parth,

The attached HTML file is your target state for the portfolio page. This document explains what the page does, what changed from v1, what you need to implement, and includes the global terminology changes that apply across the whole site.

The HTML is the authoritative spec. If anything in this document conflicts with the HTML, the HTML wins. Read this document first for context, then use the HTML as your build reference.

Context: What Has Changed Since Your Last Brief

Your last brief (May 26) covered only the Macro · Runic page (S4). The portfolio page was not spec'd at that time. This document is the first full portfolio spec. It also includes site-wide terminology changes that apply to all pages.

Key new elements vs the old Portfolio scene (S7) placeholder:

- Portfolio v4 is a fully built page. The old S7 was a stub. Replace it entirely.
- Regime-aware scenario switching (NORMAL / STRESS / LOW VOL) is now functional — one click updates all numbers across the entire page simultaneously.
- Dollar scale corrected: all amounts based on \$100,000,000 portfolio (old placeholder used \$500,000).
- Correlation matrix: now investment-type level (8×8), not individual stock pairs.
- Macro Override warning pill added to the regime strip — surfaces for manual review, does not auto-change the ceiling.

What the Portfolio Page Does

Three sub-views accessible from the left nav:

1. Sized Allocations

Shows the system's recommended position sizes for this week, organised by investment type (e.g. Semiconductors, Financials, Global risk-on). Each position shows: which analysis function generated the signal, the Business Quality (BQ) score, the size tier (MAX / TACTICAL / REDUCED / BLOCKED), the dollar allocation, and any flags (MULTI-SIG, FD+, FD-, YIELD TRAP).

2. Portfolio Risk

Where the user enters their actual holdings. Shows a correlation matrix (investment-type level, 8×8), a sector weight bar chart, and an actions required list. The right panel has a typeahead ticker search for entering positions.

3. Live P&L

A table of open positions showing entry price, current price, shares, market value, P&L, BQ score, size tier, and flags.

Changes from v1 to v4

Structural Changes

What changed	v1 state	v4 state
Forced Portfolio tab	Exists in left nav	Removed entirely
Portfolio size reference	\$500,000	\$100,000,000
Regime buttons	Visible but non-functional	NORMAL / STRESS / LOW VOL all update all numbers simultaneously
AUTO vs MANUAL badge	Not present	• AUTO = system-driven regime. • MANUAL = user has overridden.

Regime Strip Changes (Top Bar — All Pages)

What changed	v1 state	v4 state
72% ceiling	Shown twice (gold + white)	Shown once only in gold
Formula trail	Separate item, duplicated	Shown dimly beside the single 72% figure
Combo C and F	Not shown together	Both shown in amber strip with hover tooltips
Macro Override warning	Not present	New red pill: ⚠️ MACRO OVERRIDE — hover explains CAPE 42× and regional war flags. Does not auto-change ceiling.

Correlation Matrix

What changed	v1 state	v4 state
Matrix type	Individual stock pairs	Investment-type level (8×8)
Diagonal values	Incorrect (not 1.00)	Always 1.00 — critical fix

Breach list	Not present	Separate card below matrix, pairs $\rho > 0.85$ only
-------------	-------------	--

Text Contrast (All Pages)

Many nav sidebar and calc box labels were using #333 — near-invisible on the dark background. Minimum values:

- Secondary labels: #999
- Primary labels: #ccc
- Highlighted values: #e0e0e0

See v4 CSS variables for exact values throughout.

Label and Terminology Changes

Two sets of changes: (A) portfolio-page specific, (B) site-wide. Apply both.

A. Portfolio-Specific Label Changes

Old label	New label	Notes
BQ +9	Business Quality (BQ) +9	Spell out on first use in any view. Hover tooltip: scale is -15 to $+15$.
fd_positive / fd_negative	FD+ / FD-	Full form: Fundamental Divergence (FD+) / (FD-). FD+ = Upsize allocation. FD- = Downsize. Remove “bonus” from all FD+ copy.
+10%pp bonus	Upsize allocation +10 percentage points	
CS flag	MULTI-SIG	Tooltip: multiple analysis functions confirming same direction on same asset. Affects sizing only — not entry decision.
Cluster (user-facing)	Investment type name	e.g. “Semiconductors budget” not “semiconductors cluster budget”. Fine in code/tooltips.
M / W / D	Monthly / Weekly / Daily	Full words in all signal tables. Tooltip on column header — see exact text below.
Column: Cluster	Investment type	Live P&L table column rename only.

Signal frequency column header tooltip — use this text exactly: “Data frequency: the interval at which the analysis function processes data. Monthly = longer-duration trade, typically holds weeks to

months. Weekly = shorter duration, days to weeks. Daily = short-term, days. Not a reference to charting — the functions process price and volume data at the specified frequency."

B. Site-Wide Terminology Changes (Apply to All Pages)

These are global find-and-replace items. Apply across all scenes, not just Portfolio.

- **STRATEGIC BRAVE → STRATEGIC BULLISH.** Applies everywhere on the site. Brave implies hardship; current regime is easy-money/bullish.
- **Combo A direction labels: BRAVE → EASY MONEY, FEARFUL → TIGHT MONEY.** Combo A is derived from FCI + WALCL (financial conditions index). Easy money / Tight money describes those conditions directly and is less confusing than Brave/Fearful. Applies to Combo A only — Combos B, C, D, F retain BULLISH / BEARISH.

Divyanshu is aligning the backend JSON field values to match. Implement in the UI now. The JSON will catch up on his next deploy.

Conviction Page (S6) — Cosmetic Only

No structural changes. Terminology updates only:

- **BQ** → "Business Quality (BQ)" in the nav sidebar and page header.
- **Dimension 12 row:** change display label from "divergence_signal" to "Fundamental Divergence (FD) — divergence_signal".
- **fd_positive / fd_negative in nav** → "FD+ (Upsize +10 pct pts)" and "FD- (Downsize -15 pct pts)".

Functional Requirements — Regime Switcher

When the user clicks NORMAL, STRESS, or LOW VOL, the following must update simultaneously — no partial updates:

- Regime strip: ceiling number and formula text
- Regime strip: cash line (e.g. "\$28M cash @ 3.5% p.a. ≈ \$980k/yr")
- Left nav calc box: ceiling %, equity deployed \$, cash \$, note text
- Sub-header bar text
- Summary panel: deployed figure, sub-label, deploy bar width
- Summary panel: cluster dollar amounts (proportionally scaled)
- Cash waterfall: equity deployed \$, cash \$, idle income estimate
- Status bar regime text

● **AUTO** / ● **MANUAL badge**: NORMAL is the system-driven regime — shows green ● AUTO. STRESS and LOW VOL are scenario planning overrides — show amber ● MANUAL.

Scenario Values

Scenario	Equity ceiling	Equity (\$100M)	Cash	Formula
NORMAL	72%	\$72M	\$28M	80% regime max × 1.00 × 1.00 × 0.90 credit
STRESS	58%	\$58M	\$42M	65% regime max × 1.00 × 1.00 × 0.90 credit
LOW VOL	80%	\$80M	\$20M	85% regime max × 1.00 × 1.00 × 0.95 credit

See the `switchR()` function in the v4 HTML for the exact JS implementation. Match this logic precisely.

Sizing Rules Reference (for Tooltip Content)

These values appear in hover tooltips throughout the page. Keep them consistent everywhere.

Business Quality (BQ) Tiers

BQ score	Size tier	Allocation
BQ ≥ +8	MAX	100% of its investment type budget share
BQ +5 to +7	TACTICAL	75%
BQ +2 to +4	REDUCED	40%
BQ < +2	BLOCKED	0% — no position

Fundamental Divergence (FD) Adjustments

- **FD+** (price fell, business quality improved — hidden opportunity): Upsize allocation by +10 percentage points on top of BQ tier.
- **FD-** (price rose, business quality fell — hidden risk): Downsize allocation by −15 percentage points.

MULTI-SIG

When 2 or more different analysis functions signal the same direction on the same asset in the same week, that asset's win rate score is multiplied by 1.10 before ranking within its investment

type budget. This gives it a larger dollar allocation within the budget — not a separate bonus on top.

Yield Trap

When both conditions are simultaneously true — dividend yield above threshold AND Altman Z-score above distress threshold — the position is hard blocked. No entry. Not overrideable by any other rule.

What NOT to Change

- Demo data values, signal logic, BQ scoring methodology — Divyanshu/Ahil's domain.
- Overwatch panel (S8) — separate spec being prepared.
- Signals (S3), Macro (S4), SSI (S5) — no changes in this brief.

Items for Divyanshu / Ahil (Not Parth's Work)

Included here for visibility. These are backend items, not UI work.

- **INC-02:** portfolio_sizer.py VIX percentile window to be updated from 1yr to 3yr. Separate email sent to Ahil.
- **INC-06:** Win rate column in Live P&L table to be added once Ahil confirms the field is available in portfolio_sizer.py output.
- Overwatch panel auto-open on drawdown approach: separate specification being prepared.
- STRESS and LOW VOL versions of investment type budgets (CLUSTER_BUDGETS): Ahil to confirm values before Parth wires them in.

Please confirm once you've reviewed the v4 HTML and flag anything unclear before you start.

Thanks,

Rohit
